Guillain-Barré syndrome can progress rapidly

Ally Ebert’s symptoms began with an achy neck and weak, tingling legs. After multiple tests and scans, including a spinal tap, doctors were able to officially diagnose her with Guillain-Barré.

1. Hands and feet begin to have a tingling sensation.
2. Muscle weakness sets in on both sides of the body, making it difficult to climb stairs or walk.
3. Within two weeks, the respiratory system could become paralyzed.
