

Do you suffer from **painful or unsightly plantar warts** on the bottom of your feet? These infections are small, benign, highly vascular epithelial neoplasms that may occur alone or in a multiple presentation, and are caused by the human papillomavirus (HPV). Plantar warts are uncomfortable, painful, and contagious.

They may spread to cover the entire sole of the foot if not properly treated by a foot specialist. These painful growths on the bottom of your feet can even throw off your balance while walking. Have you tried OTC remedies or even cryo-surgery without relief? Come in today for your professional consultation.

Our clinic has many different treatment options to help your feet get rid of ugly plantar warts.
