The quintessential small town for family, business life and recreation. Hamilton is a charming beach town with an amazing village that has a unique blend of urban and rural qualities. Our downtown is located along the south shore of Hamilton Lake and offers many restaurants, merchants and professional services.

Hamilton is a great place to experience real community. Come walk the nature trails and see the amazing wildlife, “Dink the kitchen” on our 6 pickleball and tennis courts, rent your favorite ride whether it be an e-bike, boat or golf cart or just enjoy a leisurely walk down the boardwalk and view the beautiful Millpond Fountain.

Although we have remained a small town, historically our population explodes in the summer months due to the appeal of our beautiful lake.

Don’t miss your opportunity to live, work or play in Hamilton.

Large crowds always congregate in downtown Angola for the annual Fourth of July parade, as seen in this photo from July 4, 2024. New Census data is showing that Steuben County lost population between 2023 and 2024 but had grown from 2020 to 2024 by 1.2%.

COMPOST AND ITS BENEFITS

What is Compost?

Compost is the product resulting from the controlled biological decomposition of organic material that has been sanitized through the generation of heat and stabilized to the point that it is beneficial to plant growth. Compost bears little physical resemblance to the raw material from which it originated.

Compost is an organic matter resource that has the unique ability to improve the chemical, physical, and biological characteristics of soils or growing media. It contains plant nutrients but is typically not characterized as a fertilizer.

From the traditional growing of plants to novel uses in stormwater management and climate change mitigation, the production and use of compost has a bright future!

Benefits of Using Compost

- Improves the soil structure, porosity, and density, thus creating a better plant root environment.
- Increases infiltration and permeability of heavy soils, thus reducing erosion and runoff.
- Improves water holding capacity, thus reducing water loss and leaching in sandy soils.
- Supplies a variety of macro and micro-nutrients.
- May control or suppress certain soil-borne plant pathogens.
- Supplies significant quantities of organic matter.
- Improves cation exchange capacity (CEC) of soils and growing media, thus improving their ability to hold nutrients for plant use.
- Supplies beneficial microorganisms to soils and growing media.
- Improves and stabilizes soil pH.
- Can bind and degrade specific pollutants.
- Can closely simulate the characteristics of wetland soils, thereby encouraging the reestablishment of native plant species
- Can be used with great success as a mulch for erosion control.
