

FRESH AIR & FEWER FLIES

Practical comfort for horses and the people who care for them

Late summer is when barn life gets hardest. Flies are at peak pressure, heat has settled in, and ammonia builds in stalls and aisles with every warm day. For horses it means constant irritation. For everyone who works around them, it means pushing through conditions that wear you down. Both problems are manageable — and more connected than most people realize.

BYE BYE INSECTS — BOTANICAL PROTECTION FOR HORSES AND THEIR PEOPLE

We wanted a fly spray we could use on ourselves, so we made one. Bye Bye Insects is a botanical fly repellent formulated for horses and the people working alongside them. Made with essential oils, it repels biting and non-biting insects from the body, legs, and face. The fresh scent and light feel have made it a favorite for horses and the riders, trainers, and barn managers working with them every day.

Apply any time you or your horses need relief from biting insects.

BYE BYE ODOR — A FRESHER BARN MEANS FEWER FLIES

Barn odor and fly pressure are directly related. The ammonia and organic odors produced by manure, urine, and sweat are part of what draws pest insects to your property. Addressing the odor addresses part of the problem.

Bye Bye Odor uses beneficial microbes to neutralize ammonia and organic odors at the source — not mask them. Apply in stalls, tack areas, pet beds, coops, hutches, and trailers for a farm that is more comfortable for your family and your animals.

Together, Bye Bye Insects and Bye Bye Odor give horses and the people who care for them a noticeably better summer.
