

Houston Run MFG.

2025 CATALOG

We have a large selection of JD300 Husker aftermarket parts in stock and ready to ship. If you need a part that is not listed in this catalog, contact us. We also have a selection of good used parts.

We rebuild JD300 Huskers and Corn Heads to like-new condition, and have a good selection in stock in various conditions.

When ordering, always provide the part number and part description.

SHIPPING

Parts will be shipped via UPS, truck freight, USPS or local RDS.

Information in this catalog is general in nature and subject to modifications at any time.

PRICING

All prices are subject to change without notice.

TERMS

Net 30 days. **2%** service charge after 30 days (**24% per annum**). All claims and returned goods must be accompanied by original invoice. A **15%** restocking fee may be applied.

Orders of \$300.00 or more may be subject to credit approval.

- ORDER FORM**Inside Back Cover

JD 300 PICKER ADVANTAGES

- **Less Shelling** Uses a 40 series corn head with deck plates so that ears do not touch snapping rolls
- **Better for Downed Corn** The 40 series corn head has a low profile snout (use poly tin for better sliding)
- **Fewer Moving Parts** Mostly roller chains and sealed bearings
- **Easy to Service** Easy access to most bearings and sprockets
- **Large Trash Auger** Auger tumbles trash from husking bed over perforated trough to collect shelled corn (less jamming)
- **Large Fan** Removes stalks and trash before they reach the husking bed. Also gives a large blast into husking bed to loosen husks
- **Nylon Husk Brushes** Durable and easy to replace. Brush very effectively

JD 300 HUSKER OPERATING TIPS

The John Deere 300 is the fastest, simplest, pull-type husker available!

Weight and size are the same as a 2RN New Idea, but the JD 300 is much simpler mechanically and easier to work on. Plus they don't shell at the snapping rolls because it has a stripper plate 40 series combine head. The foremost complaint is that the husking bed plugs with trash. The cause of the plugging is mostly due to an aggressive non-plugging auger feed stripper plate head, and a big feeder house, allowing the husking bed to get overloaded. Following is a list of other causative factors and remedies, in order of significance.

All of the below points will also improve ear husking.

It is possible to have yellow cribs with very little husks and almost zero trash. Clean picked corn can be harvested at higher moisture levels compared to trashy corn for earlier cover crop establishment. Also less chance of moldy cribs. A 2-row updated machine in good condition will run 3-4 MPH in average conditions, 4-5 MPH in good conditions, and 1-3 MPH in trashy or downed corn. Clutch immediately if trash stops blowing out and the machine will clear on its own, *if caught in time*.

1. **Worn snapping rolls?** Straight flights that connect to short spiral must be the same height as the spiral with no groove where the spiral ends and straight flights begin. New rolls suck down more trash, shake off fewer tops, are hard surfaced, and very reasonably priced. Replace when under 12" circumference measured 1" behind where roll spirals end.
2. **To suck down more trash**, open stripper plate (deck plate) gap as far as possible without causing excessive shelling. This also produces better ear husking in the head. The optimum gap setting varies with the time of the day (close gap when damp, open when dry) as well as the variety of corn and soil type, etc. A "quick adjust" kit allows easily adjusting all rows at once via an external crank, or gear motor.
3. **Install improved "funnel" deck plates** which allows rolls to grab more ear shanks and trash via moving plates closer to rolls, in a funnel shape. Plates are also 2" longer for better downed corn pickup.
4. **6-tooth drive sprockets slow down gathering chains 25%, reducing trash intake.**
5. **Husk in damp conditions** (early a.m., late p.m., and cloudy days). Leave hard husking or trashy varieties until the next morning. It will also husk cleaner if not pushed too hard.
6. **Green high-moisture corn requires good snapping rolls.**
7. **Drive accurately, with correctly spaced head, and with planter rows.** A simple hydraulic tongue kit is available, plus plastic low tin snouts.
8. **Check maximum airflow.** First make sure all shims are between pulley halves on fan and then clean air channels by opening the lid under the feederhouse, and the handhole above the fan. Then slowly increase throttle, while picking, until kernels can be felt blowing out from lower edge of trash exhaust, then throttle back slightly. You should end up close to 1,000 RPM PTO speed. *Note: the hinged cover over the husking bed must be closed at all times.*
9. **Rubber husking rolls worn?** Rebuild when the lengthwise factory grooves start to fade or the bottom ends are grooved allowing snagging and pile ups at lower end of rolls. "new style" rubbers are a lot more aggressive, husking grooves last a lot longer, and have anti-groove tooth washers at the lower end.
10. **The formed sheet covering bottom end of the husking rolls must be smashed down smoking tight** between the mating rolls to allow ears or pebbles to slide over easily. This will prevent roll grooving, which causes snagged ears that plug the husking bed.

11. **Install roll pins at the upper end of steel husking rolls.** This will increase shelling in dry or easy-shelling corn.
12. **Plant fast drydown corn for loose husk, BT for strong stalks, and no-till for less root lodging and mud, etc.** Never leave hybrids bred for silage for picking. Leave grain or multi-use hybrids.
13. **Worn husking brushes?** There are improved heavier brushes available. Good brushes also apply downward pressure for better husking, loosens husks so roll can grab them, and keeps things moving. Replace when bristles are worn down to 4" or less.
14. **For less trash, keep cornhead up as far as possible without missing too many low ears.**
15. **Check your main slip clutch!** Jam open spur gears in husk bed with a wrench, etc. Using a torque wrench on the end of the cross shaft, the clutch should slip @ 180-190 ft. LBS (93 LB pull on 2' breaker bar).
16. **Time top trash clearing rolls** so that straight flights meet directly on top of each other.
17. **Is there a 30-tooth sprocket on the jackshaft and 24-tooth on the head input?**
18. **Add additional divider pipes in husking bed and a diverter shield behind the last roll** to force more ears between mating rolls. Try two AN107114 deflectors instead of one, if the rear of husk bed is used heavier than the front.
19. **Use the lowest drawbar position possible,** for better husk bed distribution, a 'flatter' head, and a higher wagon elevator.

Your options to decrease *in-machine shelling*, in order of significance, include:

1. Pick your corn at higher moisture levels.
2. Remove roll pins in husking bed.
3. Avoid plugging husking bed.
4. Add rubber ear movers versus original ear movers between brushes.
5. Add 4" extensions to auger flighting at overlap.
6. Rubber extensions on feeder house chain must be curved backwards, not forwards.
7. Add slippery plastic under auger.
8. Stop planting easy shelling varieties.
9. Move head auger down against trough.
10. Add plastic extensions on every second gathering chain lugs.
11. Add rubber paddle kit to wagon elevator. They are stronger than OEM metal and wider for longer chain and elevator side/bottom sheet life, coast less, and bolt on.

HEX BEARINGS

STAMPED STEEL BEARING FLANGES

These flanges are housing units for standard ball bearings. One housing unit consists of two identical self-aligning flanges. Each pair of flanges has a spherical inside surface which mates with the spherical outer surface of the ball bearing ring to provide self-alignment in any direction. They are all zinc-plated. PLEASE NOTE: They are sold by the half; not by the set.

2-BOLT FLANGES

(sold by the half; not by the set)

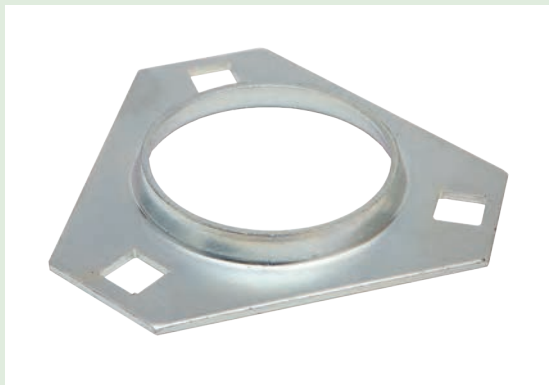

Part #	Shaft Size	For Bearing Series	Bolt C-C Distance	Price per Half

140100	Quick Hitch	\$150.00
RTYP14	1/4" Poly Rope (sold by the foot)	\$0.09

1 Row Cornpicker

The one row Houston Run corn picker is built to meet high yields and expectations, and has been tested and proven in the harshest conditions.

LESS SHELLING • BETTER HUSKING • FEWER MOVING PARTS

Combine corn head with deck plates and aggressive knife rolls

8 roll husking bed for better husking

Aggressive trash rolls get rid of most trash before corn gets to husking bed

Shields open up for easy access to all moving parts

Large trash auger with perforated floor saves shelled corn from husking bed

FEATURES

- A low profile head features a combine row unit with stripper plates, which eliminates shelling in the field, and picks up downed corn better.
- A wide first elevator and aggressive trash rolls eliminate plugging.
- Three sets of nylon husk brushes keep corn flowing well over husking bed.
- A wide 8-roll husking bed improves husking.
- A powerful fan blows stalks and loose trash out the back before corn reaches the husking rolls.
- An aluminum belt conveyor moves clean ears to the wagon, is gentle on ears, and lightweight.
- A large auger below the husking bed tumbles the husk over a perforated floor to separate and save any shelled corn.
- Rugged design with fewer moving parts and easy access to all parts.
