

# The Heart of the Matter.

## Did you know your cardiovascular system can affect your hearing?

The inner ear is extremely sensitive to blood flow. Studies have shown that a healthy cardiovascular system – your heart, arteries, and veins – has a positive effect on hearing.

A comprehensive hearing evaluation may help determine if you are at risk for hearing loss due to health conditions such as diabetes, heart disease, high cholesterol, strokes, high blood pressure, and more.

Call today to schedule an appointment for a thorough examination with a Doctor of Audiology, who has the education, training, and experience to help you diagnose your hearing loss and discuss options for your hearing health care.
